CASE STUDY 01 | PUBLIC-DOCUMENT WALKTHROUGH

FDA Q9(R1): source status and human review

Question

How should an RA reviewer see the original status wording and its uncertainty before a company-specific applicability decision?

Official evidence

FDA guidance landing page identifies the final Q9(R1) guidance and prior draft. Final PDF and draft PDF are the reviewer sources. The example compares a short status passage. It is not a complete document diff or a binding-rule finding.

BEACON + RIS path

Preserve source URL and version/hash; expose the exact old/new span; prepare an extractive RIS brief with citations and unknowns; map only candidate product/site/dossier/SOP impacts using synthetic context; require a named human review. Release remains false.

Observed result and boundary

A recruiter can inspect evidence links, source wording and a guarded review path. Independent RA sign-off, complete PDF comparison, actual company applicability and regulatory accuracy have not been measured.

Reviewer next action

Inspect both complete official documents, establish the reference answer without seeing BEACON output, then record jurisdiction, lifecycle, product scope and decision on a saved version.

Case type: public-evidence demonstration. No regulatory approval or validated outcome claimed.
