CASE STUDY 03 | SYNTHETIC REGRESSION AFTER A REAL RULE DEFECT

Draft “must”: fail closed on lifecycle uncertainty

Failure mode

The earlier deterministic rule could treat “must” in a supplied draft or withdrawn passage as review-ready when supporting status text existed. That would overstate lifecycle readiness.

Correction

Check current passage and document status for draft, proposed, consultation, withdrawn and superseded markers. Keep those candidates on HOLD and applicability UNKNOWN. A named reviewer must verify the official source and make the decision.

Regression evidence

The deployed BEACON demonstration previously reported 30/30 synthetic pattern-by-authority scenarios and 63/63 broader automated checks. These are repeated synthetic fixtures, not 30 independently reviewed official changes. The separate pilot repository in this handoff passed 8/8 focused backend tests, including a draft-obligation HOLD fixture.

What remains

Archive actual prior/current official documents. A qualified RA professional establishes a blinded answer key and counts missed changes, false alerts, wrong citations and reviewer corrections. No real regulatory accuracy percentage or 100% guarantee is supported.

Case type: engineering regression. Synthetic fixtures are labelled; external RA validation pending.
