REGULATORY CHANGE IMPACT ASSESSMENT

Scope and boundary

Independent Portfolio Exercise. Based on Public Official Sources. Not a Commercial Regulatory Assessment. This narrow case compares FDA Q9(R1) draft-to-final status; it does not claim a complete substantive redline or company applicability.

Previous / current sources

Previous: FDA Q9(R1) draft, issued 15 June 2022; official draft PDF, PDF page 1. Current: FDA Q9(R1) final, May 2023; official final PDF, PDF page 6 / printed page 1.

Evidence checked

FDA official landing page identifies the May 2023 document as final and says it replaces the June 2022 draft. Existing BEACON source fixture points to the draft and final introductory status statements. The current FDA listing was checked on 05 October 2026.

Evidence-supported finding

The supported difference is document status: a draft describing future agency thinking versus final guidance describing current agency thinking. This is not proof of a new product-specific obligation.

REGULATORY CHANGE IMPACT ASSESSMENT / 2

What is known

Authority: FDA. Topic: quality risk management. Current listing: final, May 2023. Prior draft: June 2022. Official listing also describes a targeted revision of the earlier Q9 guidance; detailed thematic assessment lies outside this narrow draft-to-final example.

What remains unknown

No real company product, site, QRM procedure, dossier revision, manufacturing context, owner or risk record was supplied. Demo company/site/product values are synthetic. Applicability and commercial impact are UNKNOWN.

Possible impact - conditional only

A relevant organization could ask its qualified reviewer to inspect whether its QRM procedures reference draft material and whether the final text warrants procedural review. This is a review question, not a confirmed SOP change, dossier amendment or deadline.

Decision state

Official-source status: identified. Company applicability: UNKNOWN. Company impact: HOLD. Human review: REVIEW REQUIRED. No autonomous regulatory approval or release.

Risk of premature action

Treating a final guidance listing as proof of company impact could create unnecessary or incorrect document changes. Missing context cannot be replaced with a model guess.

REGULATORY CHANGE IMPACT ASSESSMENT / 3

Recommended next step

Retrieve and retain full permitted source versions; inspect exact evidence; obtain product/site/process/SOP context; assign a qualified RA/QA reviewer; record the decision on the current evidence revision.

Human review requirement

The reviewer determines applicability and required action. A source or context revision requires fresh review of affected work. Action completion does not alone establish independently verified closure.

Controlled uncertainty example

Evidence gap -> UNKNOWN / HOLD -> human review -> no unsupported impact claim -> recorded decision. This document recommends holding applicability; it does not invent a named reviewer approval.

Audit / closure boundary

The demo illustrates review and audit behavior. A real closure needs an authorized owner, supporting completion evidence and independent verification. No commercial closure is claimed.
